

# KIEL INSTITUTE **ECONOMIC OUTLOOK**

## **German Economy** Summer 2024

Finalized June 14, 2024

**No. 115 (2024|Q2)**

*Joscha Beckmann, Jens Boysen-Hogrefe, Dominik Groll, Timo Hoffmann, Nils Jannsen, Stefan Kooths, Christian Schröder und Nils Sonnenberg*

## RECOVERY GETS OFF TO A SLOW START

*Joscha Beckmann, Jens Boysen-Hogrefe, Dominik Groll, Timo Hoffmann, Nils Janssen, Stefan Kooths, Christian Schröder und Nils Sonnenberg*

The German economy is leaving the recession behind. According to leading indicators, GDP will continue to rise following the increase in the first quarter. As the year progresses, real disposable income and exports will stimulate economic activity. In addition, the effects of tighter monetary policy will gradually fade out. However, there are no signs of a strong economic momentum. Despite a moderate upward trend, business and consumer confidence remain at low levels. Moreover, structural impediments – not least demographic change – are increasingly limiting the scope for expansion. All in all, GDP we expect to grow by 0.2 percent in 2024 (spring forecast: 0.1 percent) and by 1.1 percent in 2025 (spring forecast: 1.2 percent). Although inflation has moderated noticeably and will reach 2.2 percent this year and 1.9 percent in 2025, core inflation will remain elevated for the time being. The labor market remains fairly robust, although employment will increase only slightly due to demographic change. The unemployment rate will remain broadly unchanged and will be 5.8 percent in 2025. The budget deficit will decline from 2.4 percent relative to GDP in 2023 to 1.2 percent in 2025. The debt level will remain at around 63 percent relative to GDP.

**GDP will show a moderate upward trend over the year.** Following the increase in the first quarter, leading indicators point to a further rise in GDP in the second quarter. Despite the setback in May, firms assess their business situation in the second quarter as better than in the first quarter, and industrial production in April was also somewhat higher than in the first quarter. Overall, we expect GDP to increase by 0.2 percent in the second quarter (Figure 1). GDP is expected to remain on an upward trend for the rest of the year. Dampening factors such as the restrictive monetary policy and the aftermath of the energy crisis will gradually fade out. With the moderate uptick in export markets, foreign sales will expand and increases in real disposable income will stimulate activity in consumption-related industries. However, there are no signs of strong economic momentum in the forecast period. The business and consumer climate as well as new orders remain at low levels. Moreover, the scope for expansion is diminishing as potential growth weakens ([Kiel Institute medium-run projection March 2024](#); [German language](#)).

**Gross value added and industrial production paint a different picture of the level of activity in the manufacturing industry.** Gross value added in the first quarter of the current year was almost 2 percent below the level of 2019, while industrial production was 8.6 percent lower. New orders in the manufacturing industry, meanwhile, fell by 6.8 percent in this period. Conceptually, there are several reasons for differences between gross value added and production, such as fluctuations in intermediate input ratios (as production reflects the value of output including intermediate inputs), different definitions of enterprises, or changes in the relevance of individual industries. Although production is a good indicator of short-term fluctuations in manufacturing activity, gross value added is probably a better indicator for longer-term comparisons. In fall 2023, the Federal Statistical Office included additional information

**Figure 1:**  
Gross domestic product

Quarterly data: Volumes, seasonally and calendar adjusted.  
Annual data (boxes): Volumes, change in percent.

Source: Federal Statistical Office, *Fachserie 18, Series 1.2 and 1.3*; shaded: Kiel Institute forecast.

in the calculation of gross value added with the cost structure survey for 2021 and subsequently revised the level of gross value added upward substantially by about 4 percent, while industrial production was not subsequently revised (Figure 2). Accordingly, gross value added signals that activity in the manufacturing industry in 2023 was close to its pre-crisis level of 2019, rather than substantially below, as industrial production indicates. This implies that given the low level of new orders, gross value added would be considerably lower if the large stock of orders would not be supportive and that weak new orders will weigh on gross value added for the time being.

**German foreign trade began recovering in the first quarter of 2024.** Exports and imports rose sharply, with disruptions in the Red Sea likely only having had a minimal impact. Exports to the United States and China rose noticeably, as did exports from energy-intensive industries; consumer goods exports increased more strongly than those of capital and intermediate goods. Coupled with upward revisions of past data, exports have kept pace with global trade much better than was foreseeable a few months ago. Leading foreign trade indicators have brightened, and goods trade data for April indicated a substantial increase for the current quarter, which we estimate to be 0.8 percent for exports and 1.1 percent for imports. Overall, we expect exports to increase by 0.6 percent in the current year and 2.6 percent in 2025. For imports, we expect a decline of imports of 0.3 percent for the current year due to the low level at the beginning of the year, but an increase of 3.3 percent for the coming year. The terms of trade remained on an upward trend in the first quarter; for the current quarter, monthly trade prices for goods point to slight decrease. Overall, the terms of trade are now close to their long-term average again, and we do not anticipate any major changes for the forecast period.

Overall, we expect exports to increase by 0.6 percent in the current year and 2.6 percent in 2025. For imports, we expect a decline of imports of 0.3 percent for the current year due to the low level at the beginning of the year, but an increase of 3.3 percent for the coming year. The terms of trade remained on an upward trend in the first quarter; for the current quarter, monthly trade prices for goods point to slight decrease. Overall, the terms of trade are now close to their long-term average again, and we do not anticipate any major changes for the forecast period.

**Following the setback in the first quarter, private consumption will return to an expansionary path.** After rising since the second quarter of last year, private consumption fell by 0.4 percent in the first quarter. The fact that real disposable incomes are now rising noticeably again suggests that the first-quarter decline was only a temporary setback, and that private consumption will grow quite strongly over the forecast period. We expect real disposable income to increase by 1.7 percent this year, as net wages and salaries and monetary social benefits are set to rise sharply, while the upward pressure on consumer goods prices has eased considerably. Next year's increase will be lower, at 0.7 percent, partly because the inflation compensation bonus will no longer apply. Private consumption is likely to pick up noticeably already in the second quarter. Retail sales in April were above their first-quarter levels. Moreover, consumer sentiment has recently improved markedly (albeit from a low level), and retailers assessed their business situation in May as much more positive than in the first quarter. The European Football Championship (EURO) could also provide some tailwind for the second quarter. However, if households increase spending due to the EURO, they are likely to reduce spending in other areas, so we do not expect any significant impact on private consumption over the course of the year.<sup>1</sup> All in all, private consumption is expected to increase by 0.6 percent this year and by 1.2 percent in 2025.

**Poor financing conditions are weighing on investments in construction.** Investments in construction rose by 2.7 percent in the first quarter. However, following weather-related declines in the final

**Figure 2:**  
Revisions in gross value added in manufacturing and in industrial production

<sup>1</sup> [Box 2 in the corresponding business cycle report in German language](#) provides an empirical assessment of the impact of hosting a football World Cup or a EURO on GDP and private consumption.

quarter of 2023, this likely reflects a catch-up effect. In the second quarter, rather weak leading indicators point to a decline in investments in construction by 1.3 percent. In the further course of the year, investments in construction are likely to expand slightly again. New orders in the main construction sector are still 18 percent below the level before the ECB tightened monetary policy but have now probably bottomed out. While incoming orders in civil engineering already rose in the first quarter, there are signs of a turnaround in residential investment, which is more sensitive to interest rates. The volume of new business for residential construction loans as well as building permits increased in the first quarter. Overall, investment in construction will fall by 0.4 percent in 2024. We expect investments in construction to increase by 0.4 percent in 2025.

**The investment environment for companies is only gradually improving while the expansion of military procurement is supporting investments in machinery, equipment, and vehicles.** Investments in machinery, equipment, and vehicles fell by 0.2 percent in the first quarter. The expiry of subsidies for electric vehicles in August last year probably contributed to this decline. The high order backlog, which had counteracted a decline in investment activity due to weak capacity utilization last year, is now likely to provide less support given that new domestic orders for capital goods has further weakened. In the second quarter, we expect investments in machinery, equipment, and vehicles to decrease by 0.2 percent. As the year progresses, private investments will expand only slightly, in line with the economic trend. The still elevated level of economic policy uncertainty also has a negative impact. Incoming orders are still on a downward trend. However, the propensity to invest has recently improved slightly. Business expectations of capital goods manufacturers are pointing upwards. Public investments in machinery, equipment, and vehicles will continue to expand substantially, driven by spending from the Bundeswehr special fund. All in all, investments in machinery, equipment, and vehicles will fall by 2.1 percent in 2024. For 2025, we expect an increase of 4.4 percent.

**Inflation has continued to fall since the beginning of the year.** Inflation fell below 3 percent at the turn of the year and has continued to fall since then, reaching 2.4 percent in May. Energy prices are expected to continue to fall, with a brief interruption in the second quarter. Overall, they will fall by 3.3 percent in 2024 and by 4 percent in 2025. Prices for food and industrial goods will largely stagnate. Prices at the upstream stages of production (producer prices, import prices) have been falling for some time. Accordingly, monthly price increases for food and industrial goods at the consumer price level have gradually leveled off, although they fluctuated strongly in the short term. The dampening effects on consumer prices are expected to gradually fade over the forecast period. Prices for services have risen sharply since the beginning of the year, pushing up the core rate. From January to May, seasonally adjusted prices for services rose by an annualized average of 5.5% per month. The year-on-year rate rose to 3.9 percent in May, from 3.4 percent in April. However, this increase can be explained by the introduction of subsidized train ticket (“Deutschlandticket”) in May 2023 and an Easter-effect on package holidays. Compared with food and industrial goods, services prices nonetheless continue to rise at a relatively high rate. This is probably due to a delayed adjustment to the general increase in the price level and cost structures. The recovery of the relative price positions suggests, in isolation, that price pressures in services will continue to be elevated for some time. Consumer prices excluding energy will continue to rise at relatively high rates in 2024 and 2025 (2.8 percent and 2.4 percent respectively). With the decline in energy prices in 2024 and 2025, the overall inflation rate will be 2.2 percent in 2024 and 1.9 percent in 2025 (Table 1).

**Negotiated wages and salaries are accelerating rapidly.** Since our spring forecast in March, collective bargaining agreements have been reached in important sectors, such as retail (after more than a year of negotiations), private transportation and construction. We assume that the wholesale and foreign trade sector will adopt the agreement from the retail sector soon; in the past, these two sectors have seen a high degree of synchronization in wage developments. As the most recent collective bargaining agreements were higher than we had previously assumed, we now anticipate an overall increase in negotiated wages and salaries of 6.9 percent for 2024 (spring forecast: 6 percent), compared to 4 percent last year. In addition to the agreements in the retail sector, the very high rate is influenced by the

agreement in the public sector of the federal states, where the maximum possible amount for the inflation compensation bonus of 3,000 Euro will be paid out within one year (2024); in most other sectors, the payment is spread over two years. For 2025, we anticipate an overall increase in negotiated wages and salaries of 3.6 percent (spring forecast: 3.3 percent). Although basic pay rates will once again rise substantially, the increase in overall earnings will be noticeably dampened by the discontinuation of inflation compensation bonuses, whose tax exemption ends at the end of this year.

**Effective earnings continue to rise strongly.** Effective earnings (gross wages and salaries per employee) rose by 6.2 percent last year, considerably faster than negotiated wages and salaries. This exceptionally high positive wage drift is likely partly due to the fact that pay rises were probably already implemented in the retail sector last year as a result of the protracted wage dispute. The German Retail Federation recommended a voluntary pay increase of 5.3 percent starting October 2023, which could be offset against a later collective agreement. In this respect, the wage increases now agreed to in the retail sector may have already been implemented to a considerable extent, which, by itself, will increase the wage drift in 2023 and reduce it in 2024. In addition, part of last year's wage drift is due to the minimum wage increase to 12 Euro in October 2022. For the current year, we expect a slightly weaker yet still strong increase in effective earnings of 5.6 percent before wage dynamics calm down in the coming year (+3.2 percent). The high increases in labor costs together with faltering labor productivity lead to a sharp rise in real unit labor costs, particularly this year. This will, however, merely represent a return of real unit labor costs to their long-term average after the big drop due to the surge in inflation.

**Unemployment continues to rise for the time being.** The number of people in employment has continued to rise moderately in recent months; the previously reported very strong increase in January is no longer evident following a revision of the official data. At the same time, the rise in unemployment has continued more or less steadily. In May, a seasonally adjusted 2.76 million persons (rate: 5.9 percent) were registered as unemployed. This implies that unemployment has increased by around 280,000 persons over the past two years, after adjustment for the effect of the registration of Ukrainian refugees. According to the IAB Labour Market Barometer, local employment agencies expect unemployment to continue to rise in the coming months. Leading indicators for employment have also changed little recently and point to a continued moderate increase in employment. Against this backdrop, we expect further increases in both employment and unemployment for the remainder of this year. Unemployment should then gradually begin to decline due to the recovery in economic activity. In contrast, the aging of the labor force, which we estimate will reach its peak during the forecast period, will stand in the way of stronger increases in employment. Estimates are, however, subject to considerable uncertainty, as age-specific participation rates and immigration are difficult to forecast. All in all, we expect the unemployment rate to average 5.9 percent in 2024 and 5.8 percent in 2025, after 5.7 percent in 2023 and 5.3 percent in 2022.

**The budget balance of the general government is expected to improve in 2024 and 2025.** In the current year, the discontinuation of subsidies for energy consumers has led to lower expenditures at the federal level. However, payments for social transfers in kind are likely to increase substantially in both years, as prices in this field were subdued in the years following the COVID-19 crisis and are now likely to adjust to overall price trends. We also expect government investments and interest payments to increase substantially. Overall, the shrinking deficit is attributed to flourishing revenues, supported by higher rates for social security and the discontinuation of VAT tax reliefs. Consequently, the deficit will decrease to 1.7 percent of GDP in 2024 and 1.2 percent in 2025, while government expenditure relative to GDP will continue to increase.

**Table 1:**  
**Key indicators**

	2022	2023	2024	2025
Gross domestic product (GDP), price-adjusted	1.8	-0.2	0.2	1.1
